SUMMARY

Subject matter: Derivational and Syntactical Attributive Constructions in the German Language (the Alternative Choice)

Author: Alekhina S.O.

Supervisor: Malinin B.A., PhD, Professor

The supervising organization: the German Language and Cross Cultural Communication Chair

The topicality of the research lies in the insufficient development of the fundamentals of the theory of designation of the reality object by a word combination or a composite word

The aim of the research is identifying opportunities and conditions of nominations with the help of attributive type word combinations with the noun as the main word and composite attributive words with a qualititative adjective as the first component

Objectives:
- To identify extra linguistic factors determining attributive structure forms;
- To set the contextual constraints of the composite word formation;
- To identify the causes of restrictions of mutual transformation of the free word combination and the word of the attributive type.

The theoretical value of the research lies in the fact that its findings can help to reveal the conditions of creation of the nomination forms under consideration and identify the semantic and pragmatic factors taking into account the contextual environment of the data actualization of the nomination units.

The practical value of the research lies in the fact its findings can be used in teaching German Lexicology, when writing course papers and final qualifying works, in teaching the German language.

The results obtained: the alternative choice of a word combination or a composite word of the attributive type is determined by many linguistic and extra-linguistic factors
